<i>Foreword</i>	v
<i>List of Figures</i>	vii
<i>List of Tables</i>	xi
<i>List of Examples</i>	xiii
<i>Glossary</i>	xvii
<i>Introduction</i>	xxiii
1. Samples and Selection Effects	1
1.1 Introduction: which sample for which science goal? .	1
1.1.1 General rules to optimize the scientific returns from a survey of distant galaxies . .	1
1.2 General rules for estimating magnitudes	5
1.2.1 Monochromatic and integrated magnitudes .	5
1.2.2 Photometric systems	6
1.2.3 Total magnitudes and proxies	7
1.2.4 Absolute magnitudes	8

1.3	Pre-selection of a sample prior to redshift measurement	9
1.3.1	Photometric catalogs	9
1.3.2	Statistics: which size for a redshift survey?	9
1.3.3	Cosmological variance	11
1.3.4	Depth of the photometry and selection effects related to surface-brightness	11
1.3.5	Other selection effects: Malmquist bias, Eddington bias, and lensing effects	13
1.3.6	K-correction and choice of the selecting magnitude	17
1.4	Redshift surveys	21
1.4.1	Redshift measurements and spectroscopic selection effects	21
1.4.2	Determination of the LF, uncertainties and completeness tests	24
1.4.3	Examples of surveys (CFRS, DEEP2, VVDS, zCOSMOS, and WIGGLEZ)	30
1.5	Photometric redshifts	34
1.6	Selection of very distant galaxies at $z \gg 1$	37
1.6.1	Lyman break galaxies (LBGs)	37
1.6.2	Balmer and 400nm break drop-out galaxies	40
1.6.3	Ly α emitters (LAEs)	41
1.6.4	Indirect probes: damped Ly α systems (DLAs) and gamma ray burst hosts	41
1.6.5	Dust-enshrouded galaxies	42
1.6.6	Towards an overview of the high- z galaxy population and a fair determination of the LFs	42
1.7	Relating distant and nearby galaxies	44
	Bibliography	48
2.	Imaging and Photometry	55
2.1	Introduction	55

2.2	Basic Elements of imaging and image analysis	57
2.2.1	Spatial resolution	57
2.2.2	Depth	62
2.2.3	Spectral Bandwidth	68
2.2.4	Observing with imagers	73
2.3	Data Reduction	75
2.3.1	Basic principles	75
2.3.2	Description of basic calibration frames	77
2.3.3	Reducing and calibrating images	78
2.3.4	S/N ratio	82
2.4	Galaxy Morphology	86
2.4.1	Morphological classifications	87
2.4.2	Characterizing morphology at high redshifts	89
2.4.3	Empirical methods — Eyeball classifications	92
2.4.4	Light decomposition using software	92
2.4.5	Automatic methods with two or more parameters	96
2.4.6	A pragmatic and conservative approach to classify distant galaxies	101
2.5	Multi-wavelength photometry	107
2.5.1	Cross-correlating images at different wavelengths	108
2.5.2	Aperture photometry	110
2.6	Spectral energy distributions (SEDs)	119
2.6.1	Impact of the stellar populations: which wavelength tells you what?	119
2.6.2	Impact of dust and gas	121
2.6.3	Estimating galaxy properties from an SED	126
2.6.4	Estimating stellar mass	130
2.6.5	Estimating galaxy SFRs	136
	Bibliography	141

3.	Integrated Spectroscopy	155
3.1	Introduction	155
3.1.1	Desiccating a galaxy spectrum	157
3.1.2	Integrated spectroscopy of distant targets	161
3.2	Basics of spectroscopy	162
3.2.1	Multi-object spectrographs	164
3.2.2	Slit-less grism spectrographs	165
3.2.3	NIR spectrographs	166
3.3	Preparing observations	166
3.3.1	The choice of spectral resolution	167
3.3.2	Optimization of the S/N ratio	168
3.3.3	Minimizing the impact of the sky background	172
3.4	Data reduction	178
3.4.1	Main steps	178
3.4.2	Characterize the quality of the data reduction	183
3.5	Emission lines	186
3.5.1	Emission line properties	186
3.5.2	Proper methods for measuring emission lines	188
3.5.3	Low S/N regime: measurement bias	193
3.6	Emission diagnostics of the ionized ISM	194
3.6.1	Dust extinction	195
3.6.2	Active galactic nuclei	203
3.6.3	Star formation rate (SFRs)	207
3.6.4	Direct measurement of the gas metallicity (T_e method)	210
3.6.5	Indirect metallicity estimates from strong line ratios	215
3.7	Absorption line diagnostics of ISM & IGM	219
3.7.1	Measuring absorption lines	220
3.7.2	Back-illuminated neutral Hydrogen gas	224
3.7.3	Absorption lines from the ISM of distant starbursts	233

3.8	Properties of stellar populations	239
3.8.1	Spectral Evolution of SSPs	241
3.8.2	Lick indices	245
3.8.3	Full spectra fitting	248
3.8.4	Velocity dispersion	253
3.9	Conclusion	253
	Bibliography	255
4.	Integral Field Spectroscopy	267
4.1	Introduction	267
4.2	Basics of IFU instruments	271
4.2.1	Fiber instruments	272
4.2.2	Image slicer instruments	273
4.2.3	Compromise between resolutions and S/N	274
4.2.4	Spatial resolution	275
4.2.5	Spectral resolution and crosstalk	277
4.2.6	Observing with IFU instruments	280
4.3	Data reduction of IFU observations	281
4.3.1	Reduction of fiber data	282
4.3.2	Reduction of image slicer data	284
4.3.3	Correcting for atmospheric dispersion	285
4.3.4	Spatial, spectral smoothing, and binning	286
4.3.5	Optimizing sky subtraction with NIR IFUs	288
4.4	Mapping galaxy properties from a data cube	290
4.4.1	Measuring emission lines: methods and error budget	291
4.4.2	Mapping physical properties	294
4.4.3	Mapping the kinematics	295
4.5	Kinematics of distant galaxies	297
4.5.1	A fundamental reference: kinematics of nearby galaxies	297
4.5.2	Kinematics of distant galaxies and beam smearing	302
4.5.3	Classifications based on pure kinematics	308
4.5.4	The kinematic classification	313

4.5.5	The morpho-kinematic classification	317
4.6	Conclusion	318
	Bibliography	318
5.	Applications and Scaling Relations	323
5.1	Applications to different distant galaxy studies	323
5.2	Dissecting the properties of distant galaxies	324
5.2.1	An example of a multi-instrument and multi-wavelength survey	324
5.2.2	Description of a few individual distant galaxies	325
5.2.3	Spiral disk building and merger rate	330
5.3	Evolution of scaling relations	331
5.3.1	Tully–Fisher Relation	331
5.3.2	The evolution of the M–Z relation	337
5.3.3	SFR– M_{stellar} diagram	342
5.4	An important challenge: baryonic mass estimate	345
5.4.1	Stellar mass estimates	345
5.4.2	Gas mass estimates	347
	Bibliography	349
	Appendix A Most intense emission and absorption lines	355
	<i>Index</i>	359
