About the author ix
Preface xi

1. Overview of nanostructured and nano-enhanced membranes
1.1 Introduction: A glimpse at the various definitions and classifications 1
1.2 Overview of membrane processes 4
1.2.1 Membrane definition and transport 4
1.2.2 Classification of membrane processes 7
1.2.3 Membrane materials and structures 7
1.2.4 Membrane configurations and modules 9
1.3 The general trade-off between membrane permeability and selectivity and the need of material design at a nanoscale 10
1.4 Outlook 14
References 15

2. Membranes for blue energy conversion by pressure-retarded osmosis (PRO)
2.1 Introduction 17
2.1.1 Global salinity gradient potential 17
2.1.2 PRO and the other technologies to exploit salinity gradient energy 20
2.2 Osmotic processes and PRO 24
2.3 Configuration of PRO systems 26
2.3.1 Open-loop systems 26
2.3.2 Closed-loop system: Osmotic heat engine or osmotic battery 26
2.4 Historical aspects of PRO 27
2.4.1 Identification of internal concentration polarization (ICP) 27
2.4.2 Acknowledgment of the inadequacy of RO membranes for PRO 30
2.4.3 The introduction of pressure exchangers 32
2.4.4 The first prototype PRO installation by Statkraft 33
2.5 Main theoretical aspects of PRO 34
2.5.1 Performance metrics for full-scale systems 34
2.5.2 The maximum energy extractable 34
2.6 Nonidealities of PRO: Realistic membranes 36
2.6.1 Determination of intrinsic membrane properties, *A*, *B*, and *S* 38
2.7 Optimal PRO membrane characteristics and trade-offs 38
2.7.1 Low structural parameter to reduce ICP balanced by membrane robustness and rigidity to withstand high pressures (high-concentration differences require advances in PRO technology) 38
2.7.2 High reverse solute flux selectivity and permeability-selectivity trade-off 63
2.7.3 Fouling-resistant membranes 68
2.8 Hybrid RO-PRO systems to reduce the energy of seawater desalination 76
2.9 PRO membrane preparation 78
2.9.1 Asymmetric membranes 78
2.9.2 TFC membranes 79
2.10 Conclusions and outlook 82
References 83

3. Membranes for blue energy conversion by reverse electrodialysis (RED)
3.1 Introduction 91
3.2 RED and other electrochemical membrane processes 91
3.3 RED configurations: Open-loop and closed-loop systems 95
3.3.1 Open-loop systems 95
3.3.2 Closed-loop systems 96

3.4 Historical aspects of RED 97
3.5 Main theoretical aspects of RED 99
3.5.1 Power density 99
3.5.2 Energy extraction efficiency 100
3.5.3 Internal resistances 100
3.5.4 Spacers 101
3.5.5 IEMs 103
3.5.6 Transport mechanisms 107
3.6 Nonidealities of RED: Realistic membranes 109
3.6.1 Co-ion transport 109
3.6.2 Osmosis 109
3.6.3 Electroosmosis 109
3.7 Optimal RED membrane characteristics and trade-offs 110
3.7.1 Are thinner membranes advantageous for RED? 110
3.7.2 Does charge density enhance both permselectivity and membrane resistance? 114
3.7.3 Monovalent and multivalent permeable membrane: Which is better for RED performance? 120
3.7.4 Membrane versus spacer fouling: Which is more relevant in RED? 121
3.7.5 Profiled membranes vs spacers: Trade-off between mass transfer and pressure drop 124
3.8 RED as energy storage device 126
3.9 RED membrane preparation 128
3.9.1 Phase separation by solvent evaporation 128
3.9.2 Pore filling 128
3.9.3 Innovative fabrication methods 128
3.10 Conclusions and outlook 129
References 131

4. Nanostructured membranes for gas and vapor separation
4.1 Introduction: A broader context 139
4.2 Background 145
4.2.1 Permeation theory 145
4.2.2 Trade-off relationship: The upper bound and its theoretical justification 158
4.2.3 Free volume and microporosity 159
4.2.4 Physical aging 162
4.2.5 Plasticization 164
4.3 Perfluoropolymers 165
4.4 Polynorbornenes 169
4.5 Polymers of intrinsic microporosity 171
4.5.1 From PIM-1 to triptycene-based PIMs 173
4.5.2 Further advances in the design of upper bound PIMs: Benzotriptycene-based PIMs 178
4.5.3 PIMs functionalization 180
4.5.4 Physical aging and its mitigation 182
4.6 Thermal rearranged polymers 185
4.7 Conclusions and outlook 194
References 194

5. Mixed matrix membranes for gas separation
5.1 Introduction 203
5.2 A historical excursus on MMMs 203
5.2.1 The first fillers tested in MMMs: Zeolites 203
5.2.2 The milestone of MMMs based on MOFs and ZIFs 208
5.3 Filler engineering 211
5.3.1 Filler engineering: Molecular level 211
5.3.2 Filler engineering: Particle design 216
5.4 Polymer/selective flake MMMs 221
5.4.1 Inorganic fillers into the membrane polymeric matrix 221
5.4.2 Inorganic fillers onto the membrane surface 232
5.4.3 Swelling and exfoliation of nanoporous layered filler: A difficult task 234
5.5 Polymer/filler combination: Modeling gas separation performance 236
5.5.1 Permeability-based analytical models 236
5.5.2 Semiempirical approaches 245
5.6 Preparation methods and configurations 245
5.6.1 Flat dense membranes 245
5.6.2 Asymmetric hollow fibers 246
5.6.3 Thin film composite membranes 247
5.7 Conclusions and outlook 247
References 248

6. Membranes for redox flow batteries

6.1 Introduction 255
6.2 Working principle of RFBs 257
6.3 Performance metrics of RFBs 259
6.3.1 Battery voltage 259
6.3.2 Energy density 259
6.3.3 Power density 259
6.3.4 Coulombic efficiency (CE) 259
6.3.5 Voltage efficiency (VE) 260
6.3.6 Energy efficiency (EE) 260
6.3.7 Capacity retention 260
6.4 Components of RFBs 260
6.4.1 Redox-active materials 260
6.4.2 Membranes 262
6.4.3 Electrodes 270
6.5 Types of RFBs 271
6.5.1 Iron-chromium 271
6.5.2 Iron-vanadium 280
6.5.3 All-vanadium 284
6.5.4 Zn-based hybrid RFBs (ZnRBs) 319
6.5.5 Organic RFBs (ORFBs) 332
6.6 Integrated RFBs 357
6.6.1 Solar flow batteries (SFBs) 358
6.6.2 Desalination redox flow batteries (DRFBs) 361
6.7 Evolution of the research on membrane materials for RFBs 365
6.7.1 Starting from the established technology: Nafion membranes 365
6.7.2 Ion-exchange materials alternative to Nafion 370
6.7.3 Change of concept: Nanofiltration membranes 372
6.8 Membrane preparation 380
6.8.1 Preparation of ion-exchange membranes 380
6.8.2 Preparation of porous membranes 383
6.8.3 Preparation of composite membranes 385
6.9 Conclusions and outlook 388
References 389
