<b>Preface</b>	<b>ix</b>
<b>1 Design of reinforced concrete beams and columns based on artificial neural networks</b>	<b>1</b>
1.1 What can be learned from this book?	1
1.2 An evolution of artificial neural networks in civil engineering	1
1.3 Common machine learning versus artificial neural networks with deep learning using deep layers	2
1.4 Accuracy and interpretability of common artificial intelligence models	3
References	4
<b>2 Understanding artificial neural networks: analogy to the biological neuron model</b>	<b>7</b>
2.1 A learning and memory capability similar to that of the human brain	7
2.2 Activation functions	8
References	12
<b>3 Factors influencing network trainings</b>	<b>15</b>
3.1 Requirement for good training accuracies	15
3.2 Data initialization	17
3.3 Data normalization	21
3.4 Multilayer perception	47
3.5 Training, validation, testing, and design	59
3.6 Backpropagation for adjusting weights and bias	61
3.7 Conclusions	65
References	65
<b>4 Forward and backpropagation for artificial neural networks</b>	<b>67</b>
4.1 Gradient descent algorithm	67
4.2 A simple artificial neural network with forward propagation algorithm for a reinforced concrete beam	86
4.3 Conclusions	116

<b>5 Training methods: designs based on training entire data, parallel training method, chained training scheme, and chained training scheme with revised sequence</b>	<b>117</b>
5.1 Past studies	117
5.2 Significance of the chapter	117
5.3 Machine learning models versus deep layers based on artificial neural networks for structural engineering applications	118
5.4 Artificial neural networks and big data generation	118
5.5 Feature selection scores	119
5.6 Training methods, TED, PTM, CTS, and CRS	121
5.7 Chained training scheme with revised sequence	134
5.8 Conclusions	155
Acknowledgment	156
References	156
<b>6 Singly reinforced concrete beams based on regression models and artificial neural networks</b>	<b>157</b>
6.1 Significance of the chapter	157
6.2 Generation of big data	158
6.3 Beam design by an ANN based on TED (training on entire inputs and outputs simultaneously); one forward problem and four reverse problems	161
6.4 Singly reinforced concrete beams based on shallow neural network	188
6.5 Design of singly reinforced concrete beams (machine learning)	224
6.6 Recommendations and conclusions	241
Reference	243
<b>7 Design of doubly reinforced concrete beams based on artificial neural network (deep learning) and regression models (machine learning)</b>	<b>245</b>
7.1 Introduction	245
7.2 Motivation of the artificial neural network-based design	245
7.3 Deep neural networks for structural engineering	246
7.4 Generation of large structural datasets and network training	248
7.5 Design of doubly reinforced concrete beams based on artificial neural network	254
7.6 ANN-based reverse design charts based on ACI 318-19	275
7.7 Reverse designs using Gaussian process regression models enhanced by sequence training/designing technique based on feature selection algorithms	291
7.8 Feature selections for training structural datasets	292
7.9 Chained training scheme with Revised Sequence	304
7.10 Conclusion	324
Acknowledgment	327
References	327

	<b>8 Design of reinforced columns based on artificial neural networks</b>	<b>329</b>
	8.1 Introduction	329
	8.2 Design of concrete columns	330
	8.3 Generation of big data	331
artificial	8.4 Column design by artificial neural networks based on training networks on entire data, parallel training method, and chained revised sequence: one forward design and five reverse designs	331
	8.5 Verification of an ANN-based optimization by ANN-based Lagrange and large datasets	387
	8.6 Recommendations and conclusions	390
	Acknowledgment	393
	References	394
	<b>Appendix A: Manual to use MATLAB for training artificial neural networks</b>	<b>395</b>
models	<b>Appendix B: MATLAB code for Revise Scenario 4 of Table 8.4.1</b>	<b>415</b>
