1	Introduction to linear elasticity	1
1.1	Introduction	1
1.2	State of stress	2
1.2.1	Bar under tension	2
1.2.2	Stress vector and stress tensor	4
1.2.3	Equilibrium conditions	7
1.3	Deformation and strain state	9
1.3.1	Bar under tension	9
1.3.2	Infinitesimal strain tensor	10
1.4	The generalized Hooke's law	14
1.4.1	Introduction	14
1.4.2	Three-dimensional material law	16
1.4.3	Temperature influence	17
2	Plane stress state	23
2.1	Introduction	23
2.2	Stress transformation	28
2.3	Principal stresses	30
2.4	Mohr's stress circle	33
3	Bars	45
3.1	Bars	45
3.1.1	Bar stresses	45
3.1.2	Bar deformations	50
3.1.3	Statically indeterminate bars	63
3.2	Bar systems	65
3.2.1	Statically determinate bar systems	65
3.2.2	Statically indeterminate bar systems	68

4	Beams	73
4.1	Introduction	73
4.2	Basic equations for an arbitrary reference frame	75
4.3	First cross-sectional normalization: Center of gravity C	88
4.3.1	Steiner's theorem	88
4.3.2	Selected elementary cases	91
4.3.3	Composite cross-sections	97
4.3.4	Stress analysis	104
4.4	Second cross-sectional normalization: Principal axes	115
5	Beam deflections	127
5.1	Basic equations of beam bending	127
5.2	Statically determinate single-span beams	129
5.3	Statically indeterminate single-span beams	137
5.4	Multi-span beams	140
5.5	Standard bending cases	153
5.5.1	Simply supported beams	153
5.5.2	Cantilever beams	155
5.5.3	Statically indeterminate systems	158
5.5.4	Multi-span beams and angled systems	165
5.6	Biaxial bending	169
6	Shear stresses in beams	175
6.1	Introduction	175
6.2	Thick-walled cross-sections	176
6.3	Thin-walled cross-sections	185
6.4	Shear center	201
7	Torsion	207
7.1	Introduction	207
7.2	Solid bar with circular cylindrical cross-section	209
7.3	Thin-walled bar with circular cylindrical cross-section	211
7.4	Bars with arbitrary thin-walled cylindrical cross-sections	213
7.5	Bars with open thin-walled cross-sections	219
7.6	Determination of internal moments	224
8	Energy methods	233
8.1	Work and energy	233
8.1.1	Introduction	233
8.1.2	Internal and external work	236
8.1.3	Principle of work and energy	237
8.2	Strain energy and complementary strain energy	237
8.2.1	The bar	237
8.2.2	The Euler–Bernoulli beam	244

8.2.3	Bar under torsion	248
8.2.4	Combined load	248
8.3	Application of the principle of work and energy to the determination of elastic deformations	249
8.4	The principle of virtual forces	253
8.4.1	Formulation for the beam	253
8.4.2	The unit load theorem	255
8.4.3	Use of integral tables	259
8.5	The force method	261
8.5.1	Determination of deformations of statically determinate systems	261
8.5.2	Statically indeterminate systems	270
8.6	Reciprocity theorems	278
8.6.1	Betti's theorem	278
8.6.2	Maxwell's theorem	279
8.7	Statically indeterminate systems	280
9	Buckling of bars	289
9.1	Introduction	289
9.2	Types of equilibrium	290
9.3	Determination of critical loads	292
9.4	Buckling of bars: The four Euler cases	297
9.4.1	Introductory example: Euler case II	297
9.4.2	Euler case I	300
9.4.3	Euler case III	302
9.4.4	Euler case IV	305
9.4.5	Summary of the results	306
9.5	Buckling length	307
9.6	General form of the buckling differential equation	312
	Index	321
